

# WORK PLATFORMS

*Multi-purpose platform for pruning, tree training, thinning, and pheromone placement*

## FEATURES:

- Typical applications require two platforms
- Height and width adjustability
- Adapts to most bin trailers
- 7 models available with many options or can be custom-built to your needs
- Designed to improve efficiency and safety.

**NORTHSTAR WORK PLATFORMS** are an economical solution to improve efficiency and safety in trellis orchards. These platforms attach to most bin trailers and aid in production costs associated with pruning, thinning, training of tree limbs and pheromone placement. An optional self contained pull type unit is also available for operations that do not use bin trailers as the transportation vehicle. Work platforms are available in the following combinations: two each 6' platforms; one 6' and one 8' platform; one 6' and one 10' platform; and two 8' platforms. Additional sizes are available on a custom basis. The standard platform center sections are 36" wide and are equipped with two 12" slide in extensions for a total width of 5'. You can add an additional pair of extensions available in 7" or 12" widths. Custom platform widths are available on special order. The platforms are available in two manual height adjustable versions, from 4' to 6' and 2' to 6'. The 36" wide center section floor is designed in a layered floor construction. The top floor is an expanded metal covering used during pruning, training and pheromone placement. This floor is removable for thinning. The base floor is constructed of 3" x 3" heavy-duty wire mesh which allows thinned fruit to fall to the ground. Work Platforms are also available with the following options: tapered outer rails designed for thinning, kick plates, and tethering inside rails.
